

**SYSTEM FOR ENHANCING THE TRANSMISSION SECURITY
OF THE E-MAILS IN THE INTERNET NETWORK**

Abstract

System for enhancing the security of the e-mails transmitted
5 from a sender (10) to a receiver (12) over a data transmission
network such as Internet wherein a Message Transfer Agent (MTA)
(14) associated with the sender is in charge of transmitting
over the network an original e-mail sent by the sender. The MTA
associated with the sender includes a message splitting means
10 (16) adapted to divide the original e-mail into a plurality of
chunks according to a predetermined algorithm and a
predetermined list of relay MTAs (20, 22, 24) to which are
forwarded the plurality of chunks. The system comprises a chunk
assembly agent (28) for receiving from the relay MTAs the
15 plurality of chunks and re-assembling them by using the
predetermined algorithm in order to re-build the e-mail before
sending it to the receiver.
